

## What Actually Helps the Brain Most

### The Non-Pill Truth for Seniors

As we age, it's natural to think vitamins and supplements are the main answer for memory and brain health. While supplements can help, research and real-world experience show that daily habits matter even more.

---

### 1. Cognitive Play (This Truly Matters)

Keeping the brain active is like keeping muscles strong.

Word games, trivia, category games, and light problem-solving help improve memory, focus, and confidence.

Games like **The Messed Up Game** are especially helpful because they encourage thinking, laughter, and social connection — without pressure or performance.

---

### 2. Light Daily Movement

Gentle movement increases blood flow to the brain, improves balance, and supports mood.

Walking, stretching, chair exercises, or light dancing all count.

**Move a little every day — it adds up.**

---

### 3. Sleep Consistency

Sleep is when the brain processes memories and resets for the next day.

Going to bed and waking up at the same time each day helps improve memory and focus.

---

### 4. Social Interaction & Laughter

Conversation, connection, and laughter reduce stress and strengthen the brain.

Spending time with others — even short interactions — keeps the mind sharp and the spirit lifted.

---

## ★ The Big Takeaway

Supplements can support health, but the strongest brain support comes from:

- Thinking
- Moving
- Resting
- Connecting

**These habits often outperform pills alone.**
